TWENTE COMPANY FIRST OF ITS KIND IN PHOTONIC CHIP PRODUCTION

High-precision machine placement of glass fibres for large chip production volumes

Europe is at the threshold of a technological revolution - the application of the power of light to solve our greatest global challenges. As a fast, compact, energy efficient and therefore sustainable option, it is suitable for many applications and will be an essential component of the societal challenges of the future. An important future market is the photonic chip market. The new assembly machine presented by the Fraunhofer Project Center will allow large-scale photonic chip production to become a reality in Twente. This is a first, since this high-precision work has been performed by hand for small series until now. It is therefore an important step towards mass production of the fast and energy-efficient chips for telecommunications, among others. The machine has been developed in collaboration with PHIX Photonics Assembly, an international innovator in the field of assembly and packaging services for the photonics industry.

Photonic chips are rapidly becoming widespread. They will probably tap into a world market in the new 5G mobile standard - chips that work with light are fast, broadband and energy efficient. Photonics offers great benefits in many other applications too, for instance in sensors for medical applications. Success depends on the possibility of producing and assembling the chips in large quantities. The new machine is a determining step. It places Twente at the forefront of technological development. Large-scale photonic chip production is expected to create thousands of new job opportunities.

Making the connection
The machine, developed for PHIX, is able to make the connection between the chip and the 'outside world' via sixteen extremely fine glass fibres (fibre array) which are placed in the correct position one by one. Placing the glass fibres and the chip holders is the next step in the automation process. Up to now these have all been labour-intensive production steps, the high cost of which has posed a barrier to large-scale introduction.
The machine is based on an assembly platform developed at the Fraunhofer Institute for Production Technology (IPT) in Aachen. This platform is being developed further for photonics applications at the Fraunhofer Project Center at the UT, which is a collaboration between the UT, the Fraunhofer IPT and Saxion focusing on advanced manufacturing. The Fraunhofer Project Center collaborates closely with PHIX Photonics Assembly on this project. Albert Hasper, PHIX director: "The market demand for equipment based on photonic technology will see an exponential increase. This is only the beginning. The new machine will facilitate the widespread use of chips in detecting, generating, sending, measuring and managing light."

Photonics cluster in Twente
The new assembly technology will strengthen the existing photonics activities in Twente, from basic research to new business. Photonics has a strong presence in a cluster of University of Twente research groups, in the MESA+ Institute for Nanotechnology; in the 'Applied Nanotechnology' programme at Saxion University of Applied Sciences; in about ten Twente photonics companies, including LioniX International, Phoenix Software, DEMCOM, Thales, PANalytical, IDEX Optics & Photonics, Lightmotif and Sumipro; and in some photonics spin-offs from Twente such as Dovideq Medical, Next Scan Technology,
HyBriScan and Solmates. The high-tech Twente region constitutes an integral part of PhotonDelta, the (inter)national ecosystem for integrated photonics.

**National Photonics Congress in Twente**
On Tuesday 19 June, the 12th edition of the Photonics Event will take place in The Gallery on the UT campus. This event is the Benelux and German photonics community meeting point. Organized by branch association PhotonicsNL, it is the prime event for researchers, developers, designers and engineers working in photonics application and development. At the same time, companies can become acquainted with the latest developments in the photonics field by means of a varied programme. A demo of the high-tech assembly machine can be seen on the University of Twente campus during the national Photonics Event.

**Roadmap**
The second World Technology Mapping Forum will also take place in Enschede on the University of Twente campus from Wednesday 20 June until Friday 22 June 2018, in the heart of the scientific Dutch photonics sector. The first version of the 'International Photonics Systems Roadmap' will be discussed there. At the same time, the global technology requirements from 2030 onwards will be forecast. Admission to this congress is by personal invitation only.

Footnote:
Photonics - the science of making, manipulating, transporting and detecting light - is literally everywhere: in smartphones, fibre optic broadband, energy-efficient LED lighting and life-saving laser operations, to name a few. When light particles (photons) replace electrons in most of our important technological applications, innovations which are now being developed will bring improvements in healthcare, food production, energy conservation, pollution reduction, connectivity increase and production process transformation and will open up a new field in mobility.
